

CASE STUDY

Every incident had a ticket. The same ones kept coming back.

They asked us to roll out ServiceNow so IT incidents were finally logged and tracked. The scope: tracking was never the gap — the same incidents kept recurring because nothing tied them to a root cause, and every major incident was still run by hand.

Real Problem

“Give us ServiceNow so we can finally log and track our IT incidents properly.”

Scope

Tracking wasn’t the problem — recurrence was. Incidents were closed but never linked to a root cause, so the same outages returned and majors ran on a manual bridge.

01. The Situation

A financial-services firm — a retail bank with a busy, heavily regulated IT estate — ran a service desk logging thousands of incidents a month.

Tickets were captured and closed on time and the dashboards looked healthy. Yet the same outages kept returning, major incidents dragged on, and leadership couldn’t see why. The work was being done; the signal that the same problems were repeating simply wasn’t being captured.

02. What We Found

Our diagnostic surfaced three compounding issues.

- 1. **Closed, never solved.** Incidents were resolved one by one; nothing linked recurring incidents to a common root cause, so problem management never happened.
- 2. **Major incidents run by hand.** A P1 meant manually spinning up a bridge, paging people and chasing updates — coordination lived in chat and memory.
- 3. **Routine tickets swamped the desk.** Password resets and how-do-I questions consumed analysts who should have been fixing the hard, recurring problems.

\$300k+

Over 90% of mid-size and large enterprises now say a single hour of IT downtime costs more than \$300,000 — and in a regulated bank, recurrence is risk as well as cost. When the same incidents keep coming back, that cost compounds. So we didn’t start by speeding up tickets. We started by stopping the repeats.

03. What We Did

We went after recurrence, not response time — then let the response time follow.

Route it right

ServiceNowITSM with intelligent incident routing, so incidents reach the right team first time instead of bouncing between queues.

Find the root cause

Recurring incidents linked to ServiceNow problem management, so repeat issues are traced to a single root cause and fixed for good —not closed and forgotten.

Run majors, deflect the rest

A major-incident workflow coordinatesP1s automatically —bridge,roles, comms—while a virtual agent and knowledge base deflect routine requests to self-service.

04. How We Rolled It Out

We didn’t boil the ocean. We piloted on a single service area, proved the drop in repeat incidents, then scaled — and we kept the service-desk team in the build so the workflows fit how they actually work. In a regulated environment, the audit trail mattered as much as the speed, so every automated action leaves one.

05. What An Engagement Like This Delivers

We started with a margin diagnostic across all three channels to quantify where money was escaping. Only then did we build.

~35%

Fewer repeat incidents

Recurring issues traced to root cause and closed for good.

~40%

Lower MTTR

Mean time to resolution, from routing and clean knowledge.

~30%

Routine tickets deflected

Handled by self-service and the virtual agent.

The win wasn’t faster tickets.It was incidents that finally stopped coming back.

Bring us the problem

No proposal until we understand the problem.
